Sets: Medical Testing Example

Video companion

1 Example using set theory

```
VBS: "very bad syndrome"
```

X = set of people in a clinical trial

$$S = \{x \in X : x \text{ has VBS}\}$$

$$H = \{x \in X : x \text{ does not have VBS}\}$$

$$X = S \cup H$$
 (you either have VBS or you don't)
 $S \cap H = \emptyset$ (no one both has and doesn't have it)

Point of medial testing to figure out whether a person is in S or in H

2 Test

$$P = \{x \in X : x \text{ tests positive for VBS}\}$$

 $N = \{x \in X : x \text{ tests negative for VBS}\}$
 $P \cup N = X$ (you either test positive or negative)

 $P \cap N = \emptyset$ (no one tests both positive and negative)

In a perfect world, S would equal P—the sick people would always test positive, and H would equal N—the healthy people would always test negative.

...but this is not always the case.

3 Cardinality

 $\frac{|S|}{|X|}$ = proportion of people in the study who do genuinely have VBS

 $\frac{|H|}{|X|}$ = proportion of people in the study without VBS

 $\frac{|S|}{|X|} + \frac{|H|}{|X|} = 1$

 $\begin{array}{ll} \frac{|S\cap P|}{|S|} & \text{true positive rate} & \text{would like to be close to 1} \\ \frac{|H\cap P|}{|H|} & \text{false positive rate} & \text{would like to be as small as possible} \\ \frac{|S\cap N|}{|S|} & \text{false negative rate} & \text{would like to be as small as possible} \\ \frac{|H\cap N|}{|H|} & \text{true negative rate} & \text{would like to be close to 1} \end{array}$
